## RESULT SUMMARY

The component "SuperAll #38" was tested according to the OECD Guideline for Testing of Chemicals No. 117, "Partition Coefficient (n-octanol/water) - HPLC Method". The component was soluble in the mobile phase, but with a very poor detection using a UV-detector. The poor detection made it impossible to produce a HPLC chromatogram with quality good enough to calculate the  $\log P_{ow}$ .

Using a relationship between aqueous solubility and octanol/water partition coefficient, the  $\log P_{ow}$  was calculated to be 2.9, and the component "SuperAll #38" should be classified as not bioaccumulating.

The test results reported in this document were produced by tests of samples received at SINTEF Ecotoxicological Test Laboratory. The results cannot, on the strength of this document alone, be assumed to be valid for other parts of the sampled material. SINTEF accepts no responsibility for any use that is made of the test results.

A copy of this report together with relevant raw data and other supporting documents will be kept in the GLP-files of the Laboratory for a period of at least ten years. Samples of test substances will be kept in safe storage for the same period.
